

CARE & MAINTENANCE - SILKTRIM TIMBER

VER: 1.0

Silktrim is a wood based product and care must be taken to ensure the product remains dry at all times during storage and delivery to site. Wood based products will absorb moisture from the atmosphere, which can lead to dimensional change by expanding and contracting. For the best results, protect from moisture, excessive heat, and direct sunlight.

Silktrim should be acclimatised for a period of two days in the area it is to be installed, remove mouldings from their packaging and allow them to reach EMC (Equilibrium Moisture Content) prior to installation.

Silktrim MDF Mouldings are NOT suitable for the following applications:

- Around showers, baths, saunas, spas and laundries
- For exterior applications such as swimming pools, garages and carports
- Where they are exposed to temperatures greater than 60 Degrees Celsius
- In direct contact with concrete or masonry surfaces unless separated by a damp-proof surface
- Residences using sub-floor heating
